

Reducing Customer Support Queries

Mapping business outcomes to product outcomes, a Swiggy product teardown.

PREPARED BY

Mayank Sharma

One insight reframes the whole brief.

Support queries are piling up, longer waits, a growing backlog, and rising cost to serve. The instinct is to add more agents.

BUSINESS OUTCOME

What the company wants, fewer queries, lower cost, happier customers.

PRODUCT OUTCOME

A change in user behaviour that causes it, e.g. people solve issues themselves.

The goal isn't to handle queries better, it's to prevent them from happening at all.

MAPPING OUTCOMES

How many support agents does Swiggy need?

01 · DAILY ORDERS

2,000,000

Assumed orders placed
across India each day.

02 · ×5% QUERY RATE

100,000

Share of orders that lead
to a support query.

03 · ÷80 PER AGENT

1,250

8-hour shift ÷ ~6 min a
query = 80 each.

04 · +30% BUFFER

breaks ·
peaks

Leave, breaks, lunch &
dinner demand spikes.

ESTIMATED
HEADCOUNT

≈ 1,600
agents

The chain matters more than the number, change any assumption and it instantly recomputes. Figures are illustrative.

From the reasons people call, to product outcomes.

WHY CUSTOMERS REACH OUT

PRODUCT OUTCOME, THE BEHAVIOUR WE WANT

HOW WE DELIVER IT

“Where is my order?”

Customers track their own order, no contact needed

Live map, accurate ETA & proactive delay alerts

Wrong or missing items

Customers resolve the issue themselves in-app

“Report an issue” flow with photo & instant fix

Refund & payment

Customers get refunds without an agent

Automatic instant refund for clear-cut cases

Can’t find help

Customers self-serve before opening a chat

Smart self-help & chatbot that deflects FAQs

Repeat contacts

Fewer second contacts for the same issue

Clear status & resolution progress shown in-app

How product outcomes pay off the business goal.

Don't scale the support team to meet demand, design the demand away.
