— SEGMENT SELECTION

Why Vernacular “Bharat” is the highest-impact segment for voice.

SEGMENT	Voice affinity Natural pull to speak	Addressable size India user base	Revenue / fit Monetisation upside	DECISION
Vernacular “Bharat” users Tier-2/3 & rural · Indic-language-first	Very high	~500M+ users	Long-term monetisation	✓ Proceed
Students & exam aspirants Gen Z, Tier-1 to 3 · 18–25	Medium — context-dependent	~250M students	Good but crowded	Deprioritise
Urban professionals English-comfortable · metro	Low — prefer typing for precision	~80M urban workers	High ARPU, Plus subscribers	Deprioritise
Gig & field workers Delivery, drivers, sales reps	Very high — hands-free by necessity	~100M gig workers	Price-sensitive, harder now	Phase 2
Developers & tech builders Coders, startups, Bengaluru belt	Very low — code needs precision	~10M developers	API revenue, not voice	Deprioritise
Older / low-literacy adults Late adopters, rural elders	Highest — voice is their only input	~100M+, low ChatGPT reach	Underserved but hard to reach	Phase 3

Why Vernacular Bharat wins

The **only** segment high on **both** voice affinity **and** addressable size. Gig workers match the affinity but are ~5× smaller and price-sensitive; older users are even more voice-dependent but nearly unreachable today; students are huge but their barrier is environmental — the product can’t fix a silent library.

High Medium Low

500M+ reachable · 0 AI rivals · 5× bigger than gig segment

What 30+ users told us about voice.

87%

tried voice at least once

3.45_{/5}

avg. recognition score

48%

hit wrong-word errors

13%

stopped after hitting free-tier cap

Problem framing canvas.

Segment: Vernacular “Bharat” users
Focus: voice input adoption · ChatGPT India mobile

THE TRUE PROBLEM

Vernacular users who prefer voice on WhatsApp & Google **can’t successfully use voice on ChatGPT** — the product fails them at three layers.

- 1 ASR fails on Hinglish
- 2 Social stigma in shared spaces
- 3 Typing habit is the default

Core loop today: **try** → **fail** → **abandon** → **never return**. 87% tried; 13% already stopped entirely after hitting the free-tier cap.

WHO IS THE CUSTOMER

- Geography** Tier-2/3, semi-urban & rural India
- Language** Hindi, Hinglish, Marathi, Bengali, Telugu
- Behaviour** Voice-first on WhatsApp notes & Google
- Device** Mid-range Android, often family-shared
- Plan** Free tier or ChatGPT Go — price-sensitive
- Context** Shared homes, commutes, public spaces

HOW WE KNOW IT’S REAL

- 48%

wrong-word / recognition errors
- 48%

comfortable only alone, or not at all, near others
- 23%

Hinglish code-mix confusion
- 13%

stopped after free-tier cap
- 3.45

avg. recognition score / 5
- 87%

tried at least once — intent exists

VALUE — FOR CUSTOMERS

- Voice becomes viable for Indic languages for the first time
- No script-typing friction — speak in Hindi, answer in Hindi
- Usable while multitasking, commuting, low-literacy
- Builds trust that AI understands their language & accent

VALUE — FOR THE BUSINESS

- **500M+** addressable users unlocked
- Speaking is 3–4× faster → deeper sessions
- Richer Hinglish data improves the ASR flywheel
- Competitive moat vs. Gemini Live; upgrade path to Go/Plus

WHY SOLVE IT NOW

- Market timing** — 2nd-largest market, 100M+ weekly users; the window to own vernacular AI is open.
- Competitive threat** — Gemini Live already has deep regional ASR; every month cedes ground.
- Intent confirmed** — 87% tried; the product just doesn’t deliver yet.
- Low cost to test** — Hindi nudge A/B-tests in days; ASR is a tune, not a rebuild.

Thank you.

Segment chosen, problem confirmed, framing locked. Next: designing the solution that makes voice work for the next 500 million Indians.
